MEET THE SPEAKERS

Adam Davis

Throughout my 20 odd year career I have optimised high complexity and high demand IT Services for a number of low margin, high volume commercial enterprises. In the past decade I have employed an array of IT Service Management, Lean and Agile techniques to help IT, Business and Civil Service organisations deliver more value, during periods of resource contraction and increased economic constraint.

Kanban; stop starting, start finishing

An introduction to the practice of Kanban which can be applied to Software Delivery, IT Operations and Service Support, or any type of complex knowledge work. Increasing productivity by doing less.

I have a passion for all aspects of Software Design and Development, with a love of Hack Days, Electronics and anything Tech related. I lead multiple Development Streams at RedEye to fulfil our strategic road maps. Using a variety of languages, and architectures along the way.

The Value of Side projects

Side projects are important, you can exercise your own creativity and build all sorts of random things. They allow you to pick up new skills and expand your knowledge along the way. They can just be for fun, or they may even turn into commercial success stories, or sometimes fail... but ultimately they allow us to learn something new, and more importantly, you're the boss!
